1. This communication is in response to applicants response filed on November 6, 2002.
2. The specification is objected to as failing to provide proper antecedent basis for the claimed subject matter. See 37 CFR 1.75(d)(1) and MPEP § 608.01(o). Correction of the following is required: The subject matter of claims 25-26.
3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country, or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

 Claims 8-10, 12, 14-20, ²⁴~~25~~-26 are rejected under 35 U.S.C. 102(b) as being anticipated by Podney (5,675,252).

Podney discloses a magnetic field sensor having a multilayer material, the multilayer material comprising a layer of a magnetostrictive material 5 in contact with a layer of a piezoelectric 3 material (See figs. 1-2), and the multilayer material specially when the magnetostrictive material is subjected to an

Art Unit: 2862

alternating magnetic field, a strain is induced and a detectable voltage signal in the piezoelectric material is generated and wherein during operation the sensor does not consume any external electrical power.

4. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 6-7,11,13 are rejected under 35 U.S.C. 103(a) as being unpatentable over Podney.

As to claims 6-7,11, Podney discloses a device for non-contact sensing of an electromagnetic phenomenon occurring in a magnetic field as explained above. Podney fails to show the use such device for the flow meter or as current measuring device. The use of such device for measuring current or the rotational position of the object is considered an intended manner of operation or use.

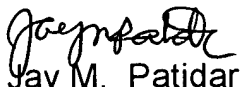

As to claim 13, supporting the sensor, as a cantilever would be within the level of ordinary skill in the art since the provision of adjustability or suitability, where needed, involves only routine skill in the art.

5. Applicant's arguments with respect to rejected claims have been considered but are moot in view of the new ground(s) of rejection.
